

MyResty Framework

MyResty Framework

基于 OpenResty 的 Web 框架，设计参考 PHP CodeIgniter 框架。

OpenResty based Web framework, designed with reference to PHP CodeIgniter framework.

> 本项目由 AI 开发 - 使用 OpenCode 平台，基于 MiniMax 模型。所有代码（包括本 README.md）均由 AI 生成。

>

> AI-Developed Project - Built using OpenCode platform, powered by MiniMax model. All code (including this README.md) was generated by AI.

致敬 OpenResty 项目 - 感谢 OpenResty 提供了如此优秀的 Web 平台。

Tribute to OpenResty - Thanks to OpenResty for providing such an excellent Web platform.

LuaJIT Best Practices / LuaJIT 最佳实践

本项目包含一份详细的 LuaJIT 最佳实践指南，基于 OpenResty 源码分析编写。

This project includes a detailed LuaJIT best practices guide, based on OpenResty source code analysis.

查看文档: [LUAJIT_BEST_PRACTICES.md](#)

主要包括:

- 模块加载与代码缓存
- 连接池使用 (MySQL、Redis)
- Lua FFI 使用最佳实践
- Lua Cosocket 使用指南
- Table 性能优化 (table.new、table.clear)
- Shared Dictionary 使用
- 代码组织模式
- 性能优化建议
- 错误处理模式
- 安全实践

Topics Covered:

- Module loading & code caching
- Connection pool usage (MySQL, Redis)
- Lua FFI best practices
- Lua Cosocket usage guide
- Table performance optimization (table.new, table.clear)
- Shared Dictionary usage
- Code organization patterns
- Performance optimization tips
- Error handling patterns

- Security practices

Requirements / 系统要求

Operating System / 操作系统

- **OS**: Ubuntu 24.04.3 LTS / Ubuntu 24.04.3 LTS

Nginx Configuration / Nginx 配置

参考 nginx/conf/ 目录下的配置文件：

Reference nginx configuration files in the nginx/conf/ directory:

```
# 主 nginx 配置模板 / Main nginx configuration template
```

```
nginx/conf/nginx.conf
```

```
# MyResty 服务器配置 / MyResty server configuration
```

```
nginx/conf/myresty.conf
```

```
# FastCGI 配置 / FastCGI configuration
```

```
nginx/conf/fcgi.conf
```

注意：生产环境的实际配置位于服务器上的 `/usr/local/web/nginx/conf/nginx.conf`，该文件会 include 本项目中的 `myresty.conf`。

Note: The actual production configuration is located at `/usr/local/web/nginx/conf/nginx.conf` on the server, which includes the `myresty.conf` file from this project.

System Dependencies / 系统依赖包

运行前需要安装 Lua FFI 调用所需的系统包（验证码、图像处理、加密）：

Before running, install the required system packages for Lua FFI calls (captcha, image processing, encryption):

```
apt-get update && apt-get install -y build-essential libc6-dev libgd-dev libpng
```

依赖说明 / Dependencies included:

Quick Start / 快速开始

```
# 安装依赖 / Install dependencies (if not already installed)
```

```
apt-get update && apt-get install -y build-essential libc6-dev libgd-dev libpng  
  
# 启动 nginx / Start nginx  
  
/usr/local/web/nginx/sbin/nginx  
  
# 测试 API / Test API  
  
curl http://localhost:8080/
```

Module Introduction / 模块功能介绍

Core Modules / 核心模块

Library Modules / 库模块

Utility Modules / 工具模块

Middleware Modules / 中间件模块

Nginx Middleware / Nginx 中间件

Controllers / 控制器

API Reference / API 参考

Controller / 控制器

控制器是所有业务控制器的基类，提供常用方法。

Controller is the base class for all business controllers, providing common methods.

```
local BaseController = require('app.core.Controller')
```

```
local UserController = {}
```

```
function UserController:new()
```

```
local instance = BaseController:new()
```

```
instance.user_model = self:load_model('user')
```

```
return setmetatable(instance, { __index = UserController })
```

```
end
```

控制器方法 / Controller Methods

Request / 请求处理

Request 模块用于解析 HTTP 请求。

Request module is used to parse HTTP requests.

```
local Request = require('app.core.Request')
```

```
local req = Request:new()
```

```
req:fetch()
```

Request 方法 / Request Methods

请求数据示例 / Request Data Example

```
-- GET 请求: /users?name=john&age=25
```

```
req:get          -- { name = "john", age = "25" }
```

```
req:segment(1)  -- "users"
```

```
-- POST 请求 (JSON): {"name":"john","email":"john@example.com"}
```

```
req:post        -- { name = "john", email = "john@example.com" }
```

```
req:json        -- { name = "john", email = "john@example.com" }
```

```
req:all_input   -- 合并后的所有输入
```

Response / 响应处理

Response 模块用于构建 HTTP 响应。

Response module is used to build HTTP responses.

```
local Response = require('app.core.Response')
```

```
local res = Response:new()
```

Response 方法 / Response Methods

响应示例 / Response Examples

```
-- JSON 响应
```

```
res:json({ success = true, data = { id = 1, name = "John" } })
```

```
res:send()
```

```
-- 成功响应
```

```
res:success({ id = 1 }, "操作成功")
```

```
res:send()
```

```
-- 失败响应
```

```
res:fail("参数错误", { field = "email" }, 400)
```

```
res:send()
```

```
-- 分页响应
```

```
res:paginate(users, 100, 1, 10)
```

```
res:send()
```

```
-- 重定向
```

```
res:redirect("/home")
```

Session / 会话管理

Session 模块提供基于加密 Cookie 的会话管理。

Session module provides encrypted cookie-based session management.

```
local Session = require('app.lib.session')
```

```
local session = Session:new()
```

```
session:start()
```

Session 方法 / Session Methods

Session 配置选项 / Session Options

Session 使用示例 / Session Example

```
local session = Session:new()
```

```
session:start()
```

```
-- 存储用户信息
```

```
session:set('user_id', 123)
```

```
session:set('username', 'john')
```

```
-- 获取用户信息
```

```
local user_id = session:get('user_id')
```

```
local username = session:get('username')
```

```
-- 检查是否存在
```

```
if session:has('user_id') then
```

```
-- 用户已登录
```

```
end
```

```
-- 销毁会话
```

```
session:destroy()
```

Cache / 缓存管理

Cache 模块基于 Nginx shared_dict 提供高性能缓存。

Cache module provides high-performance caching based on Nginx shared_dict.

```
local Cache = require('app.lib.cache')
```

```
local cache = Cache:new({
```

```
dict_name = 'my_resty_cache',
```

```
default_ttl = 3600,
```

```
prefix = 'cache:'
```

```
})
```

Cache 方法 / Cache Methods

Cache 使用示例 / Cache Example

```
local cache = Cache:new()
```

```
-- 设置缓存
```

```
cache:set('user:123', { name = 'John', age = 25 }, 3600)
```

```
-- 获取缓存
```

```
local user = cache:get('user:123')
```

```
-- 检查是否存在
```

```
if cache:exists('user:123') then
```

```
-- 缓存存在
```

```
end
```

```
-- 删除缓存
```

```
cache:delete('user:123')
```

```
-- 批量操作
```

```
cache:set('key1', 'value1')
```

```
cache:set('key2', 'value2')
```

```
local values = cache:get_multi('key1', 'key2')
```

Validation / 数据验证

Validation 模块提供 35+ 数据验证规则。

Validation module provides 35+ data validation rules.

```
local Validation = require('app.lib.validation')
```

```
local validator = Validation:new()
```

验证规则 / Validation Rules

Validation 方法 / Validation Methods

Validation 使用示例 / Validation Example

```
local validator = Validation:new()
```

```
local data = {
```

```
  email = "john@example.com",
```

```
  password = "password123",
```

```
  confirm_password = "password123",
```

```
  age = 25
```

```
}
```

```
local rules = {
```

```
  email = { "required", "email" },
```

```
  password = { "required", "length_min:6" },
```

```
  confirm_password = { "required", "match:password" },
```

```
  age = { "required", "number", "min:18", "max:120" }
```

```
}
```

```
validator:make(data, rules)
```

```
if validator:validate() then
```

```
-- 验证通过
```

```
else
```

```
local errors = validator:errors()
```

```
-- 处理错误
```

```
end
```

Router / 路由

Router 模块负责将 URL 映射到控制器方法。

Router module maps URLs to controller methods.

```
local Router = require('app.core.Router')
```

```
local route = Router:new()
```

路由方法 / Router Methods

路由参数 / Route Parameters

Router 使用示例 / Router Example

-- 静态路由

```
route: get('/users', 'user:list')
```

```
route: post('/users', 'user:create')
```

```
route: get('/users/{id}', 'user:show')
```

```
route: put('/users/{id}', 'user:update')
```

```
route: delete('/users/{id}', 'user:destroy')
```

-- 参数路由

```
route: get('/posts/{slug}', 'post:view')
```

```
route: get('/users/{id}/posts/{post_id}', 'user_post:show')
```

-- RESTful 资源路由

```
route: resource('users', 'user')
```

```
-- 自动生成:
```

```
-- GET    /users          -> user:index
```

```
-- GET    /users/new      -> user:new
```

```
-- GET    /users/{id}     -> user:show
```

```
-- GET    /users/{id}/edit -> user:edit
```

```
-- POST   /users          -> user:create
```

```
-- PUT    /users/{id}     -> user:update
```

```
-- DELETE /users/{id}     -> user:destroy
```

```
-- 路由分组
```

```
route:group({ prefix = '/api/v1', middleware = { 'auth' } }, function()
```

```
  route:get('/users', 'api_user:list')
```

```
  route:get('/orders', 'api_order:list')
```

```
end)
```

Loader / 自动加载

Loader 模块提供模块自动加载功能。

Loader module provides automatic module loading.

```
local Loader = require('app.core.Loader')
```

Loader 方法 / Loader Methods

Config / 配置管理

Config 模块加载和管理应用配置。

Config module loads and manages application configuration.

```
local Config = require('app.core.Config')
```

```
Config.load()
```

Config 方法 / Config Methods

Config 配置结构 / Config Structure

```
-- app/config/config.lua
```

```
return {
```

```
  app = {
```

```
    host = '0.0.0.0',
```

```
    port = 8080,
```

```
    base_url = '',
```

```
    log_threshold = 4,
```

```
  },
```

```
  mysql = {
```

```
    host = '127.0.0.1',
```

```
    port = 3306,
```

```
    user = 'root',
```

```
    password = '',
```

```
    database = '',
```

```
    pool_size = 100,
```

```
  },
```

```
  redis = {
```

```
host = '127.0.0.1',
```

```
port = 6379,
```

```
password = '',
```

```
pool_size = 100,
```

```
},
```

```
session = {
```

```
    cookie_name = 'session',
```

```
    cookie_max_age = 86400,
```

```
},
```

```
autoload = {},  -- 自动加载的模型
```

```
middleware = {
```

```
    { name = 'cors', phase = 'header_filter' },
```

```
    { name = 'rate_limit', phase = 'access' },
```

```
},
```

```
}
```

Middleware / 中间件

Middleware 模块管理系统中间件。

Middleware module manages application middleware.

```
local Middleware = require('app.middleware')
```

Middleware 方法 / Middleware Methods

内置中间件 / Built-in Middleware

Configuration / 配置说明

配置文件位于 app/config/config.lua，包含应用的所有可配置参数。

Configuration file is located at app/config/config.lua, containing all configurable parameters.

配置文件结构 / Config File Structure

```
-- app/config/config.lua
```

```
return {
```

```
-- 应用基础配置
```

```
app = { ... },
```

```
-- MySQL 数据库配置
```

```
mysql = { ... },
```

```
-- Redis 配置
```

```
redis = { ... },
```

```
-- 文件上传配置
```

```
upload = { ... },
```

```
-- 图像处理配置
```

```
image = { ... },
```

```
-- 验证码配置
```

```
captcha = { ... },
```

```
-- 会话配置
```

```
session = { ... },
```

```
-- 日志配置
```

```
logger = { ... },
```

```
-- 限流配置
```

```
limit = { ... },
```

```
-- 数据验证配置
```

```
validation = { ... },
```

```
-- 中间件配置
```

```
middleware = { ... }
```

```
}
```

App / 应用基础配置

MySQL / 数据库配置

Redis / 缓存配置

Upload / 文件上传配置

-- 默认允许的文件类型

```
allowed_types = {
```

```
'jpg', 'jpeg', 'png', 'gif', 'webp', -- 图片
```

```
'pdf', -- 文档
```

```
'doc', 'docx', -- Word
```

```
'xls', 'xlsx', -- Excel
```

```
'zip' -- 压缩包
```

```
}
```

Image / 图像处理配置

Captcha / 验证码配置

安全说明: 验证码加密密钥与会话使用相同的 `session.secret_key`，无需单独配置。

Session / 会话配置

安全警告:

- ``secret_key`` 必须保持机密，泄露后攻击者可伪造任意 session
- 生成新密钥命令: ``openssl rand -hex 16``
- 修改密钥会导致所有现有 session 失效

配置优先级:

1. 环境变量 `SESSION_SECRET` (最高)
 2. 环境变量 `MYRETTY_SESSION_SECRET`
 3. `config.session.secret_key`
-

Logger / 日志配置

日志级别:

Limit / 限流配置

限流策略 / Limit Strategies

限流区域 / Limit Zones

```
limit = {
```

```
zones = {
```

```
api = { limit = 60, window = 60, burst = 10 },
```

```
login = { limit = 5, window = 300, burst = 0 },
```

```
upload = { limit = 10, window = 60, burst = 2 },
```

```
default = { limit = 100, window = 60, burst = 20 }
```

```
}
```

```
}
```

Validation / 数据验证配置

默认错误消息 / Default Messages

默认字段标签 / Default Labels

Middleware / 中间件配置

中间件配置是一个数组，每个元素包含：

内置中间件 / Built-in Middleware

CORS 中间件选项 / CORS Options

Rate Limit 中间件选项 / Rate Limit Options

Auth 中间件选项 / Auth Options

中间件配置示例 / Middleware Config Example

```
middleware = {
```

```
-- 日志中间件
```

```
{
```

```
name = 'logger',
```

```
phase = 'log',
```

```
options = {
```

```
level = 'info',
```

```
format = 'combined',
```

```
request_id = true,
```

```
timing = true,
```

```
exclude_paths = ['/health', '/favicon.ico']
```

```
}
```

```
},
```

```
-- CORS 中间件
```

```
{
```

```
name = 'cors',
```

```
phase = 'header_filter',
```

```
options = {
```

```
origin = '*',
```

```
methods = {'GET', 'POST', 'PUT', 'DELETE', 'PATCH', 'OPTIONS'},
```

```
credentials = true,
```

```
max_age = 86400
```

```
}
```

```
},
```

```
-- 限流中间件
```

```
{
```

```
name = 'rate_limit',
```

```
phase = 'access',
```

```
options = {
```

```
zone = 'default',
```

```
headers = true,
```

```
log_blocked = true
```

```
},
```

```
routes = {'/api/*', '/upload/*'}

},

-- 认证中间件

{

name = 'auth',

phase = 'access',

options = {

mode = 'session',

allow_guest = true

},

exclude = {'/health', '/captcha', '/static/*', '/middleware/*'}

}

}
```

Testing / 测试

MyResty 框架提供完整的测试体系，包括单元测试和集成测试。

MyResty framework provides a complete testing system, including unit tests and

Unit Tests / 单元测试

单元测试位于 `tests/unit/` 目录，用于测试框架核心模块。

Unit tests are located in `tests/unit/`, used to test framework core modules.

单元测试目录结构 / Unit Test Structure

tests/unit/

- |—— all.lua # 测试入口，运行所有测试套件
- |—— run.lua # 测试运行器
- |—— config_spec.lua # 配置模块测试
- |—— router_spec.lua # 路由模块测试
- |—— helper_spec.lua # 辅助函数测试
- |—— request_spec.lua # 请求模块测试
- |—— response_spec.lua # 响应模块测试
- |—— query_builder_spec.lua # 查询构建器测试
- |—— cache_spec.lua # 缓存模块测试
- |—— session_spec.lua # 会话模块测试
- |—— http_spec.lua # HTTP 客户端测试
- |—— ...

测试工具 / Test Framework

测试框架位于 `app/utils/test.lua`，提供 BDD 风格的测试 API。

Test framework is located at `app/utils/test.lua`, providing BDD-style testing

```
local Test = require('app.utils.test')
```

测试工具 API / Test Framework API

函数	参数	说明
----	----	----

-----	-----	-----
-------	-------	-------

<code>**describe(name, fn)**</code>	<code>`name`</code> : 测试套件名, <code>`fn`</code> : 测试函数	定义测试套件
-------------------------------------	---	--------

<code>**it(name, fn)**</code>	<code>`name`</code> : 测试名, <code>`fn`</code> : 测试函数	定义测试用例
-------------------------------	---	--------

<code>**before_each(fn)**</code>	<code>`fn`</code> : 前置函数	每个测试前执行
----------------------------------	--------------------------	---------

<code>**after_each(fn)**</code>	<code>`fn`</code> : 后置函数	每个测试后执行
---------------------------------	--------------------------	---------

<code>**pending(name, reason)**</code>	<code>`name`</code> : 测试名, <code>`reason`</code> : 原因	标记待完成测试
--	---	---------

<code>**run(options)**</code>	<code>`options`</code> : 选项	运行所有测试
-------------------------------	-----------------------------	--------

<code>**reset()**</code>	无	重置测试状态
--------------------------	---	--------

断言函数 / Assertions

断言	说明
----	----

-----	-----
-------	-------

| `assert.equals(expected, actual, msg)` | 期望值等于实际值 |

| `assert.not_equals(expected, actual)` | 期望值不等于实际值 |

| `assert.is_true(value, msg)` | 值为 true |

| `assert.is_false(value, msg)` | 值为 false |

| `assert.is_nil(value, msg)` | 值为 nil |

| `assert.not_nil(value, msg)` | 值不为 nil |

| `assert.is_function(value, msg)` | 值是函数 |

| `assert.is_table(value, msg)` | 值是表 |

| `assert.is_string(value, msg)` | 值是字符串 |

| `assert.has_key(key, table, msg)` | 表包含键 |

| `assert.error(fn, msg, expected_err)` | 函数抛出错误 |

| `assert.no_error(fn, msg)` | 函数不抛出错误 |

| `assert.matches(pattern, value, msg)` | 值匹配模式 |

| `assert.approx(actual, expected, tolerance)` | 近似值比较 |

运行单元测试 / Run Unit Tests

运行所有测试

lua tests/unit/all.lua

安静模式（最小输出）

```
lua tests/unit/all.lua --quiet
```

JSON 格式输出

```
lua tests/unit/all.lua --json
```

运行单个测试套件

```
lua tests/unit/run.lua
```

```
#### 编写单元测试 / Write Unit Tests
```

```
-- tests/unit/my_feature_spec.lua
```

```
package.path = '/var/www/web/my-openresty/?.lua;/var/www/web/my-openresty/?.init.lua;/usr/local/web/?.lua;;'
```

```
package.cpath = '/var/www/web/my-openresty/?.so;/usr/local/web/lualib/?.so;;'
```

```
local Test = require('app.utils.test')
```

```
describe = Test.describe
```

```
it = Test.it
```

```
pending = Test.pending
```

```
before_each = Test.before_each
```

```
after_each = Test.after_each
```

```
assert = Test.assert
```

```
describe('MyFeature', function()
```

```
  local feature
```

```
    before_each(function()
```

```
      -- 每个测试前创建新实例
```

```
      feature = { value = 0 }
```

```
    end)
```

```
    after_each(function()
```

```
      -- 每个测试后清理
```

```
      feature = nil
```

```
    end)
```

```
    it('should initialize with zero value', function()
```

```
      assert.equals(0, feature.value)
```

```
    end)
```

```
    it('should increment value', function()
```

```
      feature.value = feature.value + 1
```

```
      assert.equals(1, feature.value)
```

```
    end)
```

```
    it('should handle string operations', function()
```

```
      local result = string.upper('hello')
```

```
      assert.equals('HELLO', result)
```

```
      assert.is_string(result)
```

```
end)
```

```
it('should match pattern', function()
```

```
local email = 'user@example.com'
```

```
assert.matches('@', email)
```

```
assert.matches('example', email)
```

```
end)
```

```
pending('should handle error cases', 'Not implemented yet')
```

```
end)
```

```
---
```

```
### Integration Tests / 集成测试
```

```
集成测试位于 `tests/integration/`, 通过 curl 命令测试 API 端点。
```

```
Integration tests are located in `tests/integration/`, testing API endpoints via
```

```
#### 集成测试目录 / Integration Test Directory
```

```
tests/integration/
```

```
|—— test.sh # 集成测试脚本
```

```
|—— nginx_test.conf # 测试用 Nginx 配置
```

```
|—— README.md # 测试说明文档
```

```
#### 运行集成测试 / Run Integration Tests
```

```
# 进入测试目录
```

```
cd /var/www/web/my-openresty
```

```
# 确保 nginx 已启动
```

```
/usr/local/web/nginx/sbin/nginx
```

```
# 运行所有集成测试
```

```
./tests/integration/test.sh
```

```
# 自定义测试服务器地址
```

```
BASE_URL=http://localhost:8080 ./tests/integration/test.sh
```

```
# 详细输出模式
```

```
VERBOSE=true ./tests/integration/test.sh
```

```
#### 测试脚本命令 / Test Script Commands
```

```
| 命令 | 说明 |
```

```
|-----|-----|
```

```
| `./tests/integration/test.sh` | 运行所有测试 |
```

```
| `BASE_URL=http://localhost:8080` | 自定义测试服务器 |
```

| `VERBOSE=true` | 显示详细输出 |

| `COOKIE_JAR=/tmp/cookies.txt` | 自定义 Cookie 文件 |

集成测试脚本函数 / Test Script Functions

| 函数 | 参数 | 说明 |

|-----|-----|-----|

| **`**curl_get(endpoint, description)**`** | ``endpoint``: 端点, ``description``: 描述 | G

| **`**curl_post(endpoint, data, description, content_type)**`** | ``endpoint``: 端点, `

| **`**curl_put(endpoint, data, description)**`** | ``endpoint``: 端点, ``data``: 数据, `de

| **`**curl_delete(endpoint, description)**`** | ``endpoint``: 端点, ``description``: 描述

集成测试输出示例 / Integration Test Output

=====

MyResty API Integration Test Suite

=====

Base URL: http://localhost:8080

[PASS] GET / - Root endpoint (HTTP 200)

[PASS] GET /test - Test endpoint (HTTP 200)

[PASS] GET /users - List users (HTTP 200)

[PASS] GET /users/123 - Get user by ID (HTTP 200)

[PASS] POST /users - Create user (HTTP 201)

[PASS] PUT /users/123 - Update user (HTTP 200)

[PASS] DELETE /users/123 - Delete user (HTTP 200)

[PASS] GET /session - Session index (HTTP 200)

[PASS] POST /session/set - Set session value (HTTP 200)

[PASS] POST /session/get - Get session value (HTTP 200)

[PASS] POST /session/clear - Clear session (HTTP 200)

=====

Test Results Summary

=====

Total tests: 50

Passed: 50

Failed: 0

All tests passed!

Helper Functions / 辅助函数

Helper 函数提供便捷的常用操作封装。

Helper functions provide convenient wrappers for common operations.

Request Helper / 请求辅助函数

请求辅助函数位于 `app/helpers/request_helper.lua`，提供强大的请求数据处理能力。

Request helper is located at `app/helpers/request_helper.lua`，providing powerful request data processing capabilities.

```
local RequestHelper = require('app.helpers.request_helper')
```

Request Helper 方法 / Request Helper Methods

方法	参数	返回值	说明
get(fields, rules)	`fields`: 字段列表, `rules`: 验证规则	`data`, `errors`	

| ****get_get(fields, rules)**** | 同上 | 同上 | 仅获取 GET 参数 |

| ****get_post(fields, rules)**** | 同上 | 同上 | 仅获取 POST 参数 |

| ****get_json(fields, rules)**** | 同上 | 同上 | 仅获取 JSON 参数 |

| ****get_only(fields, rules, source)**** | ``source``: 数据源 | ``data, errors`` | 带验证

| ****get_except(fields, blacklist)**** | ``blacklist``: 排除列表 | table | 获取除指定外的

| ****only(...)**** | ``...``: 字段名 | table | 仅获取指定字段 |

| ****except(...)**** | ``...``: 排除字段 | table | 排除指定字段 |

| ****merge(defaults)**** | ``defaults``: 默认值 | table | 合并默认值 |

| ****validate(fields, rules)**** | ``fields``: 字段, ``rules``: 规则 | ``valid, data, error``

| ****get_pagination_params(default_per_page)**** | ``default_per_page``: 默认每页数 |

| ****get_search_params(search_fields)**** | ``search_fields``: 搜索字段 | ``params, key``

| ****get_order_params(default_field, default_order)**** | ``default_field``: 默认排序

| ****get_date_range_params(prefix)**** | ``prefix``: 前缀 | table | 获取日期范围参数 |

请求数据源 / Request Data Sources

| 来源 | 说明 | 示例 |

|-----|-----|-----|

| `get` | URL 查询参数 | `?page=1&limit=10` |

| `post` | POST 表单数据 | `application/x-www-form-urlencoded` |

| `json` | JSON Body | `{ "name": "john", "age": 25 }` |

| `all` | 合并所有来源 | 自动合并 |

验证规则 / Validation Rules

| 规则 | 参数 | 说明 |

| ----- | ----- | ----- |

| `required` | 无 | 必填 |

| `type` | `"string"` / `"number"` / `"integer"` / `"boolean"` / `"array"` | 类型转换 |

| `default` | 默认值 | 默认值 |

| `trim` | `true` / `false` | 是否 trim |

| `strip_tags` | `true` / `false` | 是否去除 HTML 标签 |

| `lowercase` | `true` / `false` | 转为小写 |

| `uppercase` | `true` / `false` | 转为大写 |

Request Helper 使用示例 / Request Helper Example

```
local RequestHelper = require('app.helpers.request_helper')
```

```
-- 基本字段获取
```

```
local data = RequestHelper:get(self, {'name', 'email', 'age'})
```

```
-- 带类型转换
```

```
local rules = {
```

```
  name = { type = "string", default = "" },
```

```
  age = { type = "integer", default = 0 },
```

```
  is_active = { type = "boolean", default = false }
```

```
}
```

```
local data = RequestHelper:get(self, {'name', 'age', 'is_active'},  
rules)
```

```
-- 带验证
```

```
local rules = {
```

```
  username = { required = true, message = '用户名必填' },
```

```
  email = { required = true, type = "email", message = '邮箱格式错误' }
```

```
}
```

```
local valid, data, errors = RequestHelper:validate(self, {'username',  
'email'}, rules)
```

```
-- 分页参数
```

```
local pagination = RequestHelper:get_pagination_params(self, 20)
```

```
-- 返回: { page = 1, per_page = 20, sort_by = 'id', sort_order =  
'DESC', offset = 0, limit = 20 }
```

-- 搜索参数

```
local params, keyword = RequestHelper:get_search_params(self,
{'title', 'content'})
```

```
-- keyword = "hello", params = { title = "hello", content = "hello" }
```

```
---
```

```
#### File Helper / 文件辅助函数
```

文件辅助函数位于 `app/helpers/file_helper.lua`，提供文件操作和类型检查功能。

File helper is located at `app/helpers/file_helper.lua`, providing file operati

```
local FileHelper = require('app.helpers.file_helper')
```

```
##### File Helper 方法 / File Helper Methods
```

方法	参数	返回值	说明
----	----	-----	----

-----	-----	-----	-----
-------	-------	-------	-------

<code>**format_size(bytes)**</code>		<code>`bytes`</code> : 字节数	格式化大小	格式化文件大小
-------------------------------------	--	----------------------------	-------	---------

<code>**safe_path(base_path, filename)**</code>		<code>`base_path`</code> : 基础路径,	<code>`filename`</code> : 文件名	
---	--	----------------------------------	-------------------------------	--

<code>**sanitize_filename(filename)**</code>		<code>`filename`</code> : 文件名	净化后文件名	净化文件名
--	--	-------------------------------	--------	-------

| **get_extension(filename)** | `filename`: 文件名 | 扩展名 | 获取文件扩展名 |

| **mime_to_ext(mime)** | `mime`: MIME 类型 | 扩展名 | MIME 转扩展名 |

| **is_image(mime)** | `mime`: MIME 类型 | boolean | 是否为图片 |

| **is_document(mime)** | `mime`: MIME 类型 | boolean | 是否为文档 |

| **is_archive(mime)** | `mime`: MIME 类型 | boolean | 是否为压缩包 |

| **is_audio(mime)** | `mime`: MIME 类型 | boolean | 是否为音频 |

| **is_video(mime)** | `mime`: MIME 类型 | boolean | 是否为视频 |

支持的 MIME 类型 / Supported MIME Types

图片 (image): `image/jpeg`, `image/png`, `image/gif`, `image/webp`, `image/svg`

文档 (document): `application/pdf`, `application/msword`, `application/vnd.op`

压缩包 (archive): `application/zip`, `application/x-zip-compressed`, `applicat`

音频 (audio): `audio/mpeg`, `audio/wav`, `audio/ogg`, `audio/mp3`

视频 (video): `video/mp4`, `video/x-msvideo`, `video/webm`, `video/quicktime`

```
##### File Helper 使用示例 / File Helper Example
```

```
local FileHelper = require('app.helpers.file_helper')
```

```
-- 格式化文件大小
```

```
FileHelper.format_size(1024) -- "1.00 KB"
```

```
FileHelper.format_size(1048576) -- "1.00 MB"
```

```
FileHelper.format_size(1073741824) -- "1.00 GB"
```

```
-- 安全路径（防止目录遍历攻击）
```

```
local path, err = FileHelper.safe_path('/var/www/uploads', '../../../etc/passwd')
```

```
-- path = nil, err = "Path outside allowed directory"
```

```
-- 净化文件名
```

```
local safe_name = FileHelper.sanitize_filename('.././hack.php')
```

```
-- 返回 "hack.php"
```

```
-- 检查文件类型
```

```
if FileHelper.is_image('image/jpeg') then
```

```
-- 是图片
```

```
end
```

```
if FileHelper.is_document('application/pdf') then
```

```
-- 是文档
```

```
end
```

String Helper / 字符串辅助函数

字符串辅助函数位于 `app/helpers/string_helper.lua`, 提供字符串处理功能。

String helper is located at `app/helpers/string_helper.lua`, providing string m

local StringHelper = require('app.helpers.string_helper')

String Helper 方法 / String Helper Methods

方法	参数	返回值	说明	
----	----	-----	----	--

-----	-----	-----	-----	
-------	-------	-------	-------	--

trim(s)	`s`: 字符串	去除首尾空格	去除首尾空格	
-------------	----------	--------	--------	--

ltrim(s)	`s`: 字符串	去除左侧空格	去除左侧空格	
--------------	----------	--------	--------	--

rtrim(s)	`s`: 字符串	去除右侧空格	去除右侧空格	
--------------	----------	--------	--------	--

random_string(length)	`length`: 长度	随机字符串	生成随机字符串	
---------------------------	--------------	-------	---------	--

ucfirst(s)	`s`: 字符串	首字母大写	首字母大写	
----------------	----------	-------	-------	--

```
##### String Helper 使用示例 / String Helper Example
```

```
local StringHelper = require('app.helpers.string_helper')
```

```
StringHelper.trim(' hello ') -- "hello"
```

```
StringHelper.ltrim(' hello') -- "hello"
```

```
StringHelper.rtrim('hello ') -- "hello"
```

```
StringHelper.random_string(16) -- "aBc1XyZ9PqR2mNkL"
```

```
StringHelper.ucfirst('hello') -- "Hello"
```

```
---
```

```
#### URL Helper / URL 辅助函数
```

URL 辅助函数位于 `app/helpers/url_helper.lua`, 提供 URL 生成功能。

URL helper is located at `app/helpers/url_helper.lua`, providing URL generation

```
local UrlHelper = require('app.helpers.url_helper')
```

```
##### URL Helper 方法 / URL Helper Methods
```

方法	参数	返回值	说明
----	----	-----	----

```
|-----|-----|-----|-----|
```

```
| **base_url() | 无 | 基础 URL | 获取应用基础 URL |
```

```
| **site_url(uri) | `uri`: 相对路径 | 完整 URL | 生成站点 URL |
```

```
##### URL Helper 使用示例 / URL Helper Example
```

```
local UrlHelper = require('app.helpers.url_helper')
```

```
UrlHelper.base_url() -- "http://localhost:8080"
```

```
UrlHelper.site_url('users') -- "http://localhost:8080/users"
```

```
UrlHelper.site_url('api/v1') -- "http://localhost:8080/api/v1"
```

```
---
```

```
#### Captcha Helper / 验证码辅助函数
```

```
验证码辅助函数位于 `app/helpers/captcha_helper.lua`, 提供验证码生成和验证功能。
```

```
Captcha helper is located at `app/helpers/captcha_helper.lua`, providing captch
```

```
local CaptchaHelper = require('app.helpers.captcha_helper')
```

Captcha Helper 方法 / Captcha Helper Methods

方法	参数	返回值	说明
----	----	-----	----

-----	-----	-----	-----
-------	-------	-------	-------

generate(length, key)	`length`: 长度, `key`: 密钥	`code, encrypted`	生成验证码
----------------------------------	-------------------------	-------------------	-------

validate(input_code, ngx)	`input_code`: 用户输入, `ngx`: 请求对象	`valid, message`	验证验证码
--------------------------------------	---------------------------------	------------------	-------

refresh(ngx, key)	`ngx`: 请求对象, `key`: 密钥	新验证码 刷新验证码	
------------------------------	------------------------	--------------	--

get_captcha_image(code, width, height)	`code`: 验证码, `width`: 宽度, `height`: 高度	`image`	验证码图片
---	--	---------	-------

get_captcha_png_base64(code, width, height)	同上	Base64 字符串	生成 Base64 字符串
--	----	------------	---------------

Captcha Helper 使用示例 / Captcha Helper Example

```
local CaptchaHelper = require('app.helpers.captcha_helper')
```

```
-- 生成验证码
```

```
local captcha = CaptchaHelper:generate(5)
```

```
-- 返回: { code = "ABC12", encrypted = "...", cookie_name =  
"captcha_token", expires = 300 }
```

```
-- 验证验证码
```

```
local valid, message = CaptchaHelper:validate(user_input, ngx)
```

```
-- valid = true, message = "Captcha validated"
```

```
-- 生成验证码图片
```

```
local png_data = CaptchaHelper:get_captcha_image("ABC12",  
120, 40)
```

```
-- 生成 Base64 图片
```

```
local base64 = CaptchaHelper:get_captcha_png_base64("ABC12",  
120, 40)
```

```
-- 返回: "data:image/png;base64,..."
```

```
---
```

```
#### Query Helper / 查询辅助函数
```

```
查询辅助函数位于 `app/helpers/query_helper.lua`, 提供便捷的数据库查询方法。
```

```
Query helper is located at `app/helpers/query_helper.lua`, providing convenient
```

```
local QueryHelper = require('app.helpers.query_helper')
```

```
##### Query Helper 方法 / Query Helper Methods
```

```
| 方法 | 参数 | 返回值 | 说明 |
```

```
|-----|-----|-----|-----|
```

| ****table(table_name)**** | `table_name`: 表名 | QueryBuilder | 获取查询构建器 |

| ****qb(table_name)**** | `table_name`: 表名 | QueryBuilder | 同上 |

| ****db()**** | 无 | Model 实例 | 获取数据库实例 |

| ****query(sql)**** | `sql`: SQL 语句 | 结果 | 执行原生 SQL |

| ****select(sql)**** | `sql`: SQL 语句 | 结果 | 执行查询 |

| ****insert(table, data)**** | `table`: 表, `data`: 数据 | 插入结果 | 插入数据 |

| ****update(table, data, where)**** | `table`: 表, `data`: 数据, `where`: 条件 | 更新结果 | 更新数据 |

| ****delete(table, where)**** | `table`: 表, `where`: 条件 | 删除结果 | 删除数据 |

| ****count(table, where)**** | `table`: 表, `where`: 条件 | 数量 | 统计数量 |

| ****transaction(callback)**** | `callback`: 回调函数 | `ok, err` | 事务操作 |

Query Helper 使用示例 / Query Helper Example

```
local QueryHelper = require('app.helpers.query_helper')
```

```
-- 查询构建器
```

```
local users = QueryHelper.table('users'):where('status',  
'active'):get()
```

```
-- 便捷方法
```

```
QueryHelper.insert('users', { name = 'John', email =  
'john@example.com' })
```

```
QueryHelper.update('users', { status = 'active' }, { id = 1 })
```

```
QueryHelper.delete('users', { status = 'deleted' })
```

```
local count = QueryHelper.count('users', { status = 'active' })
```

```
-- 事务操作
```

```
local ok, err = QueryHelper.transaction(function()
```

```
QueryHelper.insert('users', { name = 'John' })
```

```
QueryHelper.insert('orders', { user_id = result_id, total = 100 })
```

```
end)
```

```
---
```

```
### HTTP Client / HTTP 客户端
```

HTTP 客户端位于 `app/lib/http.lua`, 基于 OpenResty cosocket 的异步 HTTP 客户端。

HTTP client is located at `app/lib/http.lua`, an async HTTP client based on OpenResty cosocket.

```
local HttpClient = require('app.lib.http')
```

```
local client = HttpClient:new({ timeout = 30000 })
```

HTTP Client 方法 / HTTP Client Methods

方法	参数	返回值	说明
----	----	-----	----

-----	-----	-----	-----
-------	-------	-------	-------

<code>**new(options)**</code>	<code>`options`</code>	配置 实例	创建客户端
-------------------------------	------------------------	---------	-------

<code>**get(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	GET 请求
------------------------------------	--	------------------------------	--------

<code>**post(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	POST 请求
-------------------------------------	--	------------------------------	---------

<code>**put(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	PUT 请求
------------------------------------	--	------------------------------	--------

<code>**patch(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	PATCH 请求
--------------------------------------	--	------------------------------	----------

<code>**delete(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	DELETE 请求
---------------------------------------	--	------------------------------	-----------

<code>**head(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	HEAD 请求
-------------------------------------	--	------------------------------	---------

<code>**options(url, options)**</code>	<code>`url`</code> : 地址, <code>`options`</code> : 选项	<code>`response, err`</code>	OPTIONS 请求
--	--	------------------------------	------------

<code>**json(url, data, method)**</code>	<code>`url`</code> : 地址, <code>`data`</code> : 数据, <code>`method`</code> : 方法	<code>`response, err`</code>	JSON 请求
--	---	------------------------------	---------

<code>**form(url, data, method)**</code>	<code>`url`</code> : 地址, <code>`data`</code> : 数据, <code>`method`</code> : 方法	<code>`response, err`</code>	Form 请求
--	---	------------------------------	---------

<code>**download(url, filepath)**</code>	<code>`url`</code> : 地址, <code>`filepath`</code> : 保存路径	<code>`success, err`</code>	下载文件
--	---	-----------------------------	------

<code>**set_timeout(timeout)**</code>	<code>`timeout`</code> : 超时时间	<code>self</code>	设置超时
---------------------------------------	-------------------------------	-------------------	------

响应结构 / Response Structure

```
{  
  status = 200, -- HTTP 状态码  
  body = '{"data":"..."}', -- 响应体  
  headers = { -- 响应头  
    ['content-type'] = 'application/json',  
    ['content-length'] = '100'  
  },  
  success = true -- 是否成功 (200-299)  
}
```

```
#### HTTP Client 使用示例 / HTTP Client Example
```

```
local HttpClient = require('app.lib.http')  
  
local client = HttpClient:new({  
  timeout = 30000,  
  pool_size = 10  
})  
  
-- GET 请求  
local res, err = client:get('https://api.example.com/users')  
if res.success then  
  local data = ngx.decode_json(res.body)  
end  
  
-- POST JSON 请求  
local res, err = client:json('https://api.example.com/users', {
```

```
name = 'John',  
email = 'john@example.com'  
})
```

-- POST 表单请求

```
local res, err = client:form('https://api.example.com/login', {  
  username = 'john',  
  password = 'secret'  
})
```

-- 带查询参数

```
local res, err = client:get('https://api.example.com/users', {  
  query = {  
    page = 1,  
    limit = 10,  
    status = 'active'  
  },  
  headers = {  
    ['Authorization'] = 'Bearer token123'  
  }  
})
```

-- 下载文件

```
local ok, err = client:download('https://example.com/file.zip', '/  
tmp/file.zip')
```

-- 设置超时

```
client:set_timeout(60000)
```

```
---
```

```
### Crypto Library / 加密库
```

```
加密库位于 `app/lib/crypto.lua`, 基于 OpenSSL FFI 的统一加密库。
```

```
Crypto library is located at `app/lib/crypto.lua`, unified encryption library b
```

```
local Crypto = require('app.lib.crypto')
```

```
#### Crypto 方法 / Crypto Methods
```

```
| 方法 | 参数 | 返回值 | 说明 |
```

```
|-----|-----|-----|-----|
```

```
| **encrypt(data, key)** | `data`: 数据, `key`: 密钥 | `encrypted, err` | AES-256
```

```
| **decrypt(data, key)** | `data`: 数据, `key`: 密钥 | `decrypted, err` | AES-256
```

```
| **base64_encode(data)** | `data`: 数据 | Base64 字符串 | Base64 编码 |
```

```
| **base64_decode(data)** | `data`: 数据 | 原始数据 | Base64 解码 |
```

```
| **random_bytes(length)** | `length`: 长度 | 随机字节 | 生成随机字节 |
```

```
| **encrypt_captcha(plaintext)** | `plaintext`: 明文 | 加密字符串 | 加密验证码 |
```

```
| **decrypt_captcha(encrypted)** | `encrypted`: 密文 | 明文 | 解密验证码 |
```

```
| **encrypt_session(plaintext)** | `plaintext`: 明文 | 加密字符串 | 加密会话 |
```

```
| **decrypt_session(encrypted)** | `encrypted`: 密文 | 明文 | 解密会话 |
```

```
#### 密钥获取顺序 / Key Priority
```

```
1. 环境变量 `SESSION_SECRET`
```

```
2. 环境变量 `MYRETTY_SESSION_SECRET`
```

```
3. 配置文件 `session.secret_key`
```

```
4. 默认密钥（不推荐用于生产）
```

```
#### Crypto 使用示例 / Crypto Example
```

```
local Crypto = require('app.lib.crypto')
```

```
-- 基本加密/解密
```

```
local encrypted = Crypto.encrypt('Hello World', '32-byte-secret-key-here!')
```

```
local decrypted = Crypto.decrypt(encrypted, '32-byte-secret-key-here!')
```

```
-- Base64 编码/解码
```

```

local encoded = Crypto.base64_encode('Hello World')
local decoded = Crypto.base64_decode(encoded)

-- 生成随机字节
local random = Crypto.random_bytes(32)
-- 返回 32 字节的随机数据

-- 验证码加密
local encrypted_captcha = Crypto.encrypt_captcha('ABC12')
local          decrypted_captcha          =
Crypto.decrypt_captcha(encrypted_captcha)
-- decrypted_captcha = 'ABC12'

-- 会话加密
local encrypted_session = Crypto.encrypt_session('{"user_id":1}')
local          decrypted_session          =
Crypto.decrypt_session(encrypted_session)
-- decrypted_session = '{"user_id":1}'

---

### Middleware Details / 中间件详情

#### Auth Middleware / 认证中间件

```

认证中间件位于 `app/middleware/auth.lua`, 支持 Session 和 Token 两种认证模式。

Auth middleware is located at `app/middleware/auth.lua`, supporting both Session and Token authentication modes.

```
local Auth = require('app.middleware.auth')
```

Auth 方法 / Auth Methods

方法	参数	返回值	说明
----	----	-----	----

-----	-----	-----	-----
-------	-------	-------	-------

<code>**setup(options)**</code>	<code>`options`</code>	配置	<code>self</code> 配置中间件
---------------------------------	------------------------	----	---------------------------

<code>**handle(options)**</code>	<code>`options`</code>	配置	boolean 执行认证
----------------------------------	------------------------	----	----------------

<code>**login(options)**</code>	<code>`options`</code>	登录数据	session 用户登录
---------------------------------	------------------------	------	----------------

<code>**logout()**</code>	无	boolean	用户登出
---------------------------	---	---------	------

<code>**get_user()**</code>	无	<code>`user_id, user_data, type`</code>	获取当前用户
-----------------------------	---	---	--------

<code>**is_guest()**</code>	无	boolean	是否为游客
-----------------------------	---	---------	-------

<code>**has_role(role)**</code>	<code>`role`</code>	角色名	boolean 是否有角色
---------------------------------	---------------------	-----	-----------------

Auth 配置选项 / Auth Options

选项	默认值	说明
-----	-----	-----
<code>`mode`</code>	<code>`session`</code>	认证模式: <code>`session`</code> , <code>`token`</code> , <code>`both`</code>
<code>`token_header`</code>	<code>`Authorization`</code>	Token 请求头
<code>`token_prefix`</code>	<code>`Bearer`</code>	Token 前缀
<code>`session_name`</code>	<code>`myresty_session`</code>	Session 名
<code>`login_url`</code>	<code>`/auth/login`</code>	登录页 URL
<code>`allow_guest`</code>	<code>`false`</code>	允许游客访问
<code>`api_key_enabled`</code>	<code>`false`</code>	启用 API Key
<code>`roles`</code>	<code>`nil`</code>	角色限制
##### Auth 使用示例 / Auth Example		

```
local Auth = require('app.middleware.auth')
```

```
-- 基本认证
```

```
Auth:setup():handle()
```

```
-- 允许游客
```

```
Auth:setup():handle({ allow_guest = true })
```

-- 角色限制

```
Auth:setup():handle({ roles = { 'admin', 'moderator' } })
```

-- Token 认证

```
Auth:setup({  
  mode = 'token',  
  token_header = 'Authorization',  
  token_prefix = 'Bearer'  
}):handle()
```

-- 登录

```
local session = Auth:login({  
  user_id = 123,  
  user_data = {  
    username = 'john',  
    email = 'john@example.com',  
    role = 'admin'  
  }  
})
```

-- 登出

```
Auth:logout()
```

-- 获取当前用户

```
local user_id, user_data, auth_type = Auth:get_user()
```

-- 检查角色

```
if Auth:has_role('admin') then
-- 是管理员
end
```

```
---
```

```
#### Rate Limit Middleware / 限流中间件
```

```
限流中间件位于 `app/middleware/rate_limit.lua`, 提供滑动窗口限流策略。
```

```
Rate limit middleware is located at `app/middleware/rate_limit.lua`, providing
```

```
local RateLimit = require('app.middleware.rate_limit')
```

```
##### RateLimit 方法 / RateLimit Methods
```

方法	参数	返回值	说明
-----	-----	-----	-----
<code>**setup(options)**</code>	<code>`options`</code>	配置	<code>self</code> 配置中间件
<code>**handle(options)**</code>	<code>`options`</code>	配置	<code>boolean</code> 执行限流
<code>**create_zone(name, limit, window, burst)**</code>	<code>`name`</code>	区域名	<code>`limit`</code> : 限制, <code>`wi</code>

| **zone(name)** | `name` : 区域名 | builder | 区域构建器 |

RateLimit 配置选项 / RateLimit Options

| 选项 | 默认值 | 说明 |

|-----|-----|-----|

| `zone` | `'default'` | 限流区域 |

| `default_limit` | `60` | 默认限制 |

| `default_window` | `60` | 默认窗口(秒) |

| `headers` | `true` | 输出限流头 |

| `key_by_ip` | `true` | 按 IP 限流 |

| `key_by_user` | `false` | 按用户限流 |

| `response_status` | `429` | HTTP 状态码 |

| `response_message` | `'Too Many Requests'` | 响应消息 |

| `log_blocked` | `true` | 记录被拦截 |

预定义区域 / Predefined Zones

| 区域 | 限制 | 窗口 | 说明 |

```
|-----|-----|-----|-----|
```

```
| `api` | 60 | 60 | API 接口限流 |
```

```
| `login` | 5 | 300 | 登录接口限流 |
```

```
| `upload` | 10 | 60 | 文件上传限流 |
```

```
| `default` | 100 | 60 | 默认限流 |
```

```
##### RateLimit 使用示例 / RateLimit Example
```

```
local RateLimit = require('app.middleware.rate_limit')
```

```
-- 基本限流
```

```
RateLimit:setup():handle()
```

```
-- 自定义区域
```

```
RateLimit:setup({
```

```
  zone = 'api',
```

```
  headers = true,
```

```
  log_blocked = true
```

```
):handle()
```

```
-- 创建新区域
```

```
RateLimit:create_zone('special', 10, 60, 5)
```

```
RateLimit:setup({ zone = 'special' }):handle()
```

-- 响应头

-- X-RateLimit-Limit: 60

-- X-RateLimit-Remaining: 59

-- X-RateLimit-Reset: 1699999999

-- X-RateLimit-Window: 60

Example Controllers / 示例控制器

框架提供多个示例控制器，演示各种功能的使用方法。

The framework provides several example controllers demonstrating various features.

Example Controller / 查询构建器示例

`app/controllers/example.lua` 演示 QueryBuilder 的各种用法。

`app/controllers/example.lua` demonstrates various QueryBuilder usages.

端点	方法	说明
-----	-----	-----
<code>/query/basic`</code>	GET	基本查询
<code>/query/joins`</code>	GET	JOIN 查询
<code>/query/where`</code>	GET	条件查询
<code>/query/aggregates`</code>	GET	聚合函数
<code>/query/insert`</code>	GET	插入示例
<code>/query/update`</code>	GET	更新示例
<code>/query/delete`</code>	GET	删除示例
<code>/query/complex`</code>	GET	复杂查询
<code>/query/raw`</code>	GET	原生表达式

-- 示例代码

```
local QueryBuilder = require('app.core.QueryBuilder')
```

-- 基本查询

```
local sql = QueryBuilder.new('users')
:select('id', 'name', 'email')
:where('status', 'active')
:order_by('created_at', 'DESC')
:limit(10)
```

```
:get_sql()
```

```
-- JOIN 查询
```

```
local sql = QueryBuilder.new('users')
```

```
:select('users.id', 'users.name', 'orders.total')
```

```
:left_join('orders')
```

```
:on('users.id', '=', 'orders.user_id')
```

```
:get_sql()
```

```
---
```

```
#### Request Demo Controller / 请求处理演示
```

```
`app/controllers/request_demo.lua` 演示 RequestHelper 的完整用法。
```

```
`app/controllers/request_demo.lua` demonstrates complete RequestHelper usage.
```

```
| 端点 | 方法 | 说明 |
```

```
|-----|-----|-----|
```

```
| `/request-demo` | GET | 索引 |
```

```
| `/request-demo/basic` | POST | 基本字段提取 |
```

```
| `/request-demo/typed` | POST | 类型转换 |
```

| `/request-demo/validate` | POST | 验证示例 |

| `/request-demo/pagination` | POST | 分页参数 |

| `/request-demo/search` | POST | 搜索参数 |

| `/request-demo/filter` | POST | 过滤参数 |

| `/request-demo/only` | POST | 仅获取指定字段 |

| `/request-demo/except` | POST | 排除指定字段 |

| `/request-demo/complete` | POST | 完整示例 |

| `/request-demo/get-post` | POST | GET vs POST vs JSON |

Middleware Demo Controller / 中间件演示

`app/controllers/middleware_demo.lua` 演示中间件系统的使用方法。

`app/controllers/middleware_demo.lua` demonstrates middleware system usage.

| 端点 | 方法 | 说明 |

|-----|-----|-----|

| ``/middleware`` | GET | 中间件索引 |

| ``/middleware/list`` | GET | 列出中间件 |

| ``/middleware/info`` | GET | 中间件信息 |

| ``/middleware/headers`` | GET | 响应头 |

| ``/middleware/auth-test`` | POST | 认证测试 |

| ``/middleware/login`` | POST | 登录 |

| ``/middleware/logout`` | POST | 登出 |

| ``/middleware/cors-test`` | GET | CORS 测试 |

| ``/middleware/rate-limit-test`` | GET | 限流测试 |

Request Test Controller / 请求测试

``app/controllers/request_test.lua`` 测试各种请求数据的获取方式。

``app/controllers/request_test.lua`` tests various request data retrieval methods

| 端点 | 方法 | 说明 |

----- ----- -----
` /request ` GET 索引
` /request/get ` GET GET 参数
` /request/post/form ` POST POST 表单
` /request/post/json ` POST POST JSON
` /request/mixed ` ANY 混合数据
` /request/all ` GET 所有输入

Validate Config Controller / 配置验证
`app/controllers/validate_config.lua` 演示基于配置文件的验证方式。
`app/controllers/validate_config.lua` demonstrates config-based validation.
端点 方法 说明
----- ----- -----
` /validate-config ` GET 索引

| `/validate-config/tables` | GET | 列出验证表 |

| `/validate-config/table/{name}` | GET | 获取表规则 |

| `/validate-config/users/{scenario}` | POST | 用户验证 |

| `/validate-config/products/{scenario}` | POST | 产品验证 |

| `/validate-config/orders/{scenario}` | POST | 订单验证 |

****支持的场景 / Supported Scenarios**:**

| 表名 | 场景 |

|-----|-----|

| `users` | `create`, `login`, `profile`, `update` |

| `products` | `create`, `update` |

| `orders` | `create`, `ship` |

Available Routes / 可用路由

框架定义了 150+ 路由，涵盖所有功能模块。

The framework defines 150+ routes covering all functional modules.

核心路由 / Core Routes

路由	控制器	说明
----	-----	----

-----	-----	-----
-------	-------	-------

`GET /`	welcome	首页
---------	---------	----

`GET /hello/{name}`	welcome	问候
---------------------	---------	----

`GET /users`	user	用户列表
--------------	------	------

`GET /users/{id}`	user	用户详情
-------------------	------	------

`POST /users`	user	创建用户
---------------	------	------

`PUT /users/{id}`	user	更新用户
-------------------	------	------

`DELETE /users/{id}`	user	删除用户
----------------------	------	------

Query Builder 路由 / Query Builder Routes

路由	说明
----	----

-----	-----
-------	-------

`GET /query/basic`	基本查询
--------------------	------

| `GET /query/joins` | JOIN 查询 |

| `GET /query/where` | 条件查询 |

| `GET /query/aggregates` | 聚合函数 |

| `GET /query/insert` | 插入示例 |

| `GET /query/update` | 更新示例 |

| `GET /query/delete` | 删除示例 |

| `GET /query/complex` | 复杂查询 |

| `GET /query/raw` | 原生表达式 |

|

会话路由 / Session Routes

|

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /session` | GET | 索引 |

| `POST /session/set` | POST | 设置会话 |

| `POST /session/get` | POST | 获取会话 |

| `POST /session/remove` | POST | 删除键 |

| `POST /session/clear` | POST | 清空会话 |

| `POST /session/destroy` | POST | 销毁会话 |

| `POST /session/flash/set` | POST | 设置 Flash |

| `POST /session/flash/get` | POST | 获取 Flash |

| `POST /session/user/login` | POST | 用户登录 |

| `GET /session/user/info` | GET | 用户信息 |

| `POST /session/user/logout` | POST | 用户登出 |

缓存路由 / Cache Routes

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /cache` | GET | 索引 |

| `POST /cache/set` | POST | 设置缓存 |

| `POST /cache/get` | POST | 获取缓存 |

| `POST /cache/delete` | POST | 删除缓存 |

| `POST /cache/clear` | POST | 清空缓存 |

| `POST /cache/incr` | POST | 增值 |

| `POST /cache/decr` | POST | 减值 |

| `GET /cache/keys` | GET | 列出键 |

| `POST /cache/remember` | POST | 记住缓存 |

| `GET /cache/stats` | GET | 统计信息 |

验证码路由 / Captcha Routes

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /captcha` | GET | 生成验证码 |

| `GET /captcha/code` | GET | 获取验证码 |

| `POST /captcha/verify` | POST | 验证验证码 |

| `POST /captcha/refresh` | POST | 刷新验证码 |

文件上传路由 / Upload Routes

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /upload` | GET | 索引 |

| `POST /upload` | POST | 上传文件 |

| `POST /upload/multiple` | POST | 多文件上传 |

| `POST /upload/validate` | POST | 验证上传 |

| `GET /upload/form` | GET | 上传表单 |

图像处理路由 / Image Routes

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /image` | GET | 索引 |

| `POST /image/upload` | POST | 上传图片 |

| `POST /image/upload/multiple` | POST | 多图上传 |

| `POST /image/upload/avatar` | POST | 上传头像 |

| `POST /image/upload/variants` | POST | 上传变体 |

| `GET /image/info/{path}` | GET | 图片信息 |

| `GET /image/thumbnail/{path}` | GET | 生成缩略图 |

| `GET /image/optimize/{path}` | GET | 优化图片 |

HTTP 客户端路由 / HTTP Client Routes

路由	方法	说明
-----	-----	-----
`GET /httpClient`	GET	索引
`GET /httpClient/get`	GET	GET 请求
`POST /httpClient/post`	POST	POST 请求
`POST /httpClient/json`	POST	JSON 请求
`POST /httpClient/api`	POST	API 调用
`GET /httpClient/benchmark`	GET	性能测试
#### 限流路由 / Rate Limit Routes		
路由	方法	说明
-----	-----	-----
`GET /rate-limit`	GET	索引
`GET /rate-limit/test`	GET	限流测试
`GET /rate-limit/status`	GET	状态查询
`POST /rate-limit/check`	POST	检查限流
`GET /rate-limit/zone`	GET	区域信息

| `GET /rate-limit/keys` | GET | 列出键 |

| `POST /rate-limit/reset` | POST | 重置限流 |

| `GET /rate-limit/login` | GET | 登录限流 |

| `GET /rate-limit/api` | GET | API 限流 |

| `GET /rate-limit/strict` | GET | 严格限流 |

| `GET /rate-limit/combined` | GET | 组合限流 |

| `GET /rate-limit/user` | GET | 用户限流 |

验证路由 / Validation Routes

| 路由 | 方法 | 说明 |

|-----|-----|-----|

| `GET /validate` | GET | 索引 |

| `POST /validate/basic` | POST | 基本验证 |

| `POST /validate/login` | POST | 登录验证 |

| `POST /validate/register` | POST | 注册验证 |

| `POST /validate/update` | POST | 更新验证 |

| `POST /validate/custom` | POST | 自定义验证 |

| `POST /validate/messages` | POST | 自定义消息 |

| `POST /validate/array` | POST | 数组验证 |

| `POST /validate/all` | POST | 完整验证 |

| `POST /validate/login-captcha` | POST | 登录验证码 |

| `POST /validate/api-key` | POST | API Key 验证 |

Features / 功能特性

- MVC 架构 (CodeIgniter 风格) / MVC architecture (CodeIgniter style)
- RESTful 路由 / RESTful routing
- MySQL 和 Redis 连接池 / MySQL & Redis connection pools
- 带 AES 加密的会话管理 / Session management with AES encryption
- 共享字典缓存 / Shared dictionary caching
- 限流 / Rate limiting
- 数据验证 (35+ 规则) / Data validation (35+ rules)
- 验证码生成 / Captcha generation
- 文件上传和图像处理 / File upload & image processing

- HTTP 客户端 / HTTP client

- 全面的中间件系统 / Comprehensive middleware system

- Helper 辅助函数系统 / Helper functions system

- 基于 FFI 的高性能加密 / FFI-based high-performance encryption

- 配置驱动的数据验证 / Config-driven data validation
